

SPATIAL COMMITMENTS FOR MOBILE MANIPULATION UNDER HOSTILE SEQUENCE-SEARCH BASELINES

Anonymous authors

Paper under double-blind review

ABSTRACT

Paper 79 asks whether a mobile manipulator should explicitly reason about base-pose commitments that make future manipulation impossible. The expanded v5 rebuild uses eight seeds, seven geometry splits, eleven planners, hard-regime aggregates, component ablations, stress sweeps, fixed-risk budgets, curated negative cases, and seed-level appendices. The terminal recommendation is **KILL_ARCHIVE**. On the decisive combined long-horizon split, SCTS-v5 reaches 0.000 ± 0.000 success, receding-horizon TAMP reaches 0.000 ± 0.000 , and robust backtracking reaches 0.000 ± 0.000 . The hard-regime aggregate success of SCTS-v5 is 0.396 ± 0.005 . We report the frozen outcome rather than polishing around it.

1 DECISION AND PROTOCOL

This manuscript is generated only from frozen CSV artifacts. The terminal recommendation is **KILL_ARCHIVE**. The summary reason is: *v5 combined=0.000, TAMP=0.000, robust=0.000; hard aggregate v5=0.396, best_non_oracle=robust_backtracking_tamp:0.396, oracle=0.396; regret v5=1.000, TAMP=1.000; max stress v5=0.000, best=reachability_margin_sampler:0.000; best ablation=no_future_loss:0.000; failed gates: hard_margin,paired_lower_bound,future_regret,max_stress,fixed_risk,ablation_necessity.*

The protocol is intentionally hostile. It compares a spatial-commitment tree-search reference against greedy reachability, navigation-then-manipulation, receding-horizon TAMP, the v4 commitment-cost planner, depth-2 rollout MPC, beam sequence search, topological graph search, robust backtracking TAMP, and an exact sequence-search oracle. The surrounding literature already includes classical motion planning, task-and-motion planning, sampling-based planning, trajectory optimization, and navigation among movable obstacles (LaValle, 2006; Kaelbling & Lozano-Perez, 2011; Garrett et al., 2021; Kavraki et al., 1996; LaValle, 1998; Ratliff et al., 2009; Kalakrishnan et al., 2011; Stilman & Kuffner, 2007).

2 THEORY SKETCH

Let x_t denote the mobile-base pose and g_i the manipulation goal at step i . A spatial commitment is a state transition $c(x_t, g_i)$ that may leave the current manipulation feasible while shrinking the future feasible set $\mathcal{F}_{i+1:T}$. A myopic planner minimizes immediate navigation and reach cost, while a commitment-aware planner should minimize

$$J(x_{1:T}) = \sum_i d(x_i, x_{i-1}) + \lambda R_i(x_i, g_i) + \beta \Delta |\mathcal{F}_{i+1:T}|,$$

where $\Delta |\mathcal{F}_{i+1:T}|$ is the predicted loss of future feasible base-pose sets. The theory predicts a narrow win condition: commitment costs matter only when the future feasible-set loss is predictable and not already handled by generic sequence search or backtracking. This is why v5 uses hostile sequence-search baselines.

Figure 5: Combined long-horizon success under fixed future-regret risk budgets.

3 MAIN RESULTS

4 AGGREGATE HARD-REGIME EVIDENCE

5 PAIRWISE STATISTICS

6 ABLATIONS

7 STRESS SWEEP

8 FIXED-RISK BUDGETS

9 NEGATIVE CASES

10 LIMITATIONS

This is a local diagnostic benchmark. It lacks real robot validation, external mobile-manipulation benchmarks, perception, learned policies, and integration with a full TAMP stack. Even a local positive result would need external validation before ICLR-main submission.

11 CONCLUSION

The evidence should be judged by hostile-review survival, not by whether the plots are pretty. The frozen v5 protocol decides whether explicit spatial commitments add value beyond generic sequence search and backtracking; the terminal recommendation above follows from that evidence.
